Helix Filter

Finishing Filter for Hydrocarbons

Helix filter is a NEW concept in filtration for the storm water market.

The Helix is a highly effective filter designed to remove hydrocarbons from flowing water with virtually no head-loss. As water passes through the filter, oil is captured and removed from the flow.

The Helix filtration material is hydrophobic and effectively filters a range of hydrocarbons including partially dissolved or emulsified oil as water passes through the filter.

As water enters the filter, the helix design creates a turbulent environment forcing the water to twist and turn as it travels through the filter ensuring the capture and encapsulation of all hydrocarbons before they exit the system.

The helix filter can be used in vault applications as well as end of pipe applications. The Helix filter does require a debris free water for maximum efficiency. Some applications will require a pre-filter for sediment and debris removal.

If you have any questions on the Helix Filter or any other product in our line, please contact us:
